

Dear DualEntry Team,

I build AI products and ship them. In the last six months: **Maya AI**, an AI operating layer on Oracle CCS for a 200K-resident utility client; a **standalone email triage agent** I spun off Maya's core intelligence; **VaultIQ**, an air-gapped Claude Opus financial intelligence platform that runs entirely inside the customer VPC; and the **Career-Ops Pipeline I built on Claude Code that generated this very application**. Before ESC Partners, I co-founded and exited two B2B ventures across the UK and MENA — combined exit value of **\$575K, 200+ agency clients, \$5M+** in agency-side deals influenced.

DualEntry is the only AI-native ERP I've seen whose JD names **agentic frameworks (LangChain / CrewAI)** alongside **Claude / GPT / Cursor**. That's my daily Tuesday. At ESC, I shipped Maya AI as the **sole AI hire** in **2.5 months** end-to-end — architecture, AWS Bedrock model routing across Claude Opus/Sonnet/Nova, **n8n agentic workflows**, FastAPI orchestration, React supervisor cockpit, and **Microsoft Teams adaptive approval cards** for HITL. The pattern is structurally identical to LangChain — tool-use, state machines, conditional routing, human-in-the-loop — just on a different orchestrator. I haven't shipped LangChain literally; picking it up is a 1-week curve. I'd happily bring a LangChain port of one Career-Ops Pipeline node to the technical screen as a "show, don't tell" artifact.

Two reasons I'm writing for the AI Product Manager seat specifically. **First, the "5+ features in parallel + translate complex workflows into simple requirements + ensure reliability/accuracy" framing is the seat I run solo today.** Maya AI is 5 channels (voice, chat, SMS, email, mobile) + supervisor cockpit + standalone email triage agent + 17 admin APIs — all shipping in parallel as a single AI builder. Translating NEP supervisors' Oracle-CCS-and-email pain into autonomous transactions taught me the same muscle DualEntry needs for accountants: **shadow customers' workflows end-to-end before writing a single PRD; ship the trust UX (HITL approval, audit trail, one-click reject) before flipping autonomous mode on.** **Second, vertical AI in a regulated, ledger-heavy domain is what I already do.** Utility billing on Oracle CCS is structurally close to ERP/GL automation — same kinds of operators, same compliance posture, same audit-trail requirement. VaultIQ already runs Claude Opus inside the customer VPC for regulated finance teams. I'd ramp on accounting domain in three weeks: shadow 5 customers' month-end close, build an internal LLM benchmark on 50 anonymized journal entries, ship one user-facing improvement to a workflow I've shadowed.

Honest disclosure: the strict "5+ years PM" reading of my profile lands at ~1 year of formal PM titles. The full math is **4 yrs 8 months bootstrapping CloudApproach + Approachables** (designed CRM automation, marketing-products, finance/billing infra across **200+ B2B clients**) + **~1 year applied AI product roles + ESC ongoing as sole AI on staff**. That's 5+ years of product+engineering combined ownership, not backlog-grooming. The "high agency, juggling multiple workstreams" line in your JD is the founder muscle, not a stretch.

I'm relocating to NYC for the right role. **Maya AI live to 200K+ users in 2.5 months as sole AI** is the closest single proof I can offer that I PM agentic AI products end-to-end at speed.
