

Dear TikTok Hiring Team,

I build AI products and ship them. In the last six months: **Maya AI**, an AI operating layer on Oracle CCS for a 200K-resident utility client; a **standalone email triage agent** I spun off Maya's core intelligence; **VaultIQ**, an air-gapped financial intelligence platform on Claude Opus and AWS Bedrock; a **3-workflow conference outreach automation** for our CRO; and, honestly, the **career-ops pipeline I built on Claude Code to apply for this role**. Before ESC Partners, I co-founded and exited two ventures across the UK and MENA — combined exit value of **\$575K**, **200+ agency clients**, **\$5M+** in deals influenced.

Maya is what I'm most proud of. Utility companies run everything on Oracle CCS — billing, outages, payment plans, service requests. When a customer reaches out, a human agent logs in, digs through Oracle, and manually responds. Maya sits on top of Oracle CCS and does that automatically across voice, chat, SMS, email, and mobile. It understands intent, pulls the right data, and executes the transaction. When confidence is low, it drafts a response, posts to a supervisor as a Microsoft Teams **adaptive approval card**, and waits for one click before sending. **26 languages** via 11 Labs. Real-time sentiment, live dashboards, one-click human takeover. Live at NEP (200K+ residents), rolling out at Moreno Valley Electrical Utility, piloting at Delta Utilities. I built it in **2.5 months as the only AI engineer on staff**.

Two reasons I'm writing for the Business Messenger AI seat specifically. **First, the AI-creative + HITL approval pattern is what I already build**. The 3-workflow system I shipped for our CRO — AI drafts → Teams approval → auto-send via Outlook + edit-form for human revision — is structurally identical to the loop advertisers need for creative review at scale. Symphony Creative Studio, Assistant, and Digital Avatars are the bigger version of what I've shipped at smaller scale. **Second, TikTok USDS is now Oracle co-owned, and I've spent the last 5 months shipping AI products on Oracle CCS**. That's a real architectural overlap, not coincidence. I know how to build inside Oracle's stack and I want to do it for advertisers next.

Honest disclosure: I haven't run paid-social budgets on TikTok or Meta. What I have is **4+ years bootstrapping CloudApproach and Approachables — marketing-products operator across 200+ agency clients across the UK and MENA**, \$200K marketing-automation budget, \$5M+ in agency-side deals influenced. That's the supply side of the ad platform — building the marketing automation, CRM, and creative pipelines for the agencies that buy on platforms like TikTok For Business. The adtech-platform vocabulary I'd be picking up; the operator instinct of running marketing-products at scale is already there. I learn fast and I build faster.

Available immediately and relocating to the Bay Area for the right role.
