

LinkedIn Messages - LEXOR, AI Forward Deployed Engineer

Short = connection-request note (under 300 characters). Long = InMail or post-connection message.

Rithik Puli - Co-Founder & CEO

[linkedin.com/in/rithik-puli-500ba11a4](https://www.linkedin.com/in/rithik-puli-500ba11a4)

Short (connection request)

Hi Rithik, just applied for the FDE role (civilian team). Quick context: ex-founder with two exits, and I built a fraud-detection model for the City of Rochester that gave loan officers defensible reason codes. Would love 15 min if the profile reads right. Happy to relocate to DC fast.

Long (InMail / post-connection)

Hi Rithik, I applied for the Forward Deployed Engineer seat on the civilian team and wanted to reach out directly. My background is the Tier 1 shape you're screening for: bootstrapped two companies across the UK and MENA, sold both for \$575K combined. Since then I've shipped production agentic AI as the first AI hire at ESC Partners, where Maya AI now handles 70 to 80% of first-touch volume for a 200K-resident utility. The reason LEXOR specifically: I built a fraud-detection model for the City of Rochester, and the lesson was that auditors act on evidence chains, not scores. I'm not a US citizen (STEM OPT today, open to O-1), so if that's workable for Team 2, I'd love 15 minutes. I can be in DC on short notice.

Saharsha Navani - Co-Founder & CTO

[linkedin.com/in/saharsha-navani](https://www.linkedin.com/in/saharsha-navani)

Short (connection request)

Hi Saharsha, applied for the FDE role. I build agentic systems in production: a tool-calling agent on Oracle CCS handling 70-80% of first-touch volume at a 200K-resident utility, RAG over pgvector, HITL autonomy. Would enjoy going deep on your agent architecture for 15 min if you're up for it.

Long (InMail / post-connection)

Hi Saharsha, I applied for the Forward Deployed Engineer role and figured the CTO deserves the technical version of the pitch. At ESC I architected Maya AI end to end: intent classification routing to tool calls that execute real transactions (billing, payment plans, outages) on Oracle CCS, model routing across Claude Opus, Sonnet, and Nova on Bedrock, DynamoDB conversation state, and a HITL layer that hands control to a supervisor in one click. I've also built VaultIQ, an air-gapped Claude Opus platform inside a customer VPC, and a government fraud model for the City of Rochester (XGBoost with SHAP). I'm on STEM OPT, so civilian team only. If the stack story sounds credible, I'd love a 15-minute technical chat.

Emilio - Recruiter (reply to InMail / outreach)

Short (connection request)

Hi Emilio, saw the Lexor FDE brief. Ex-founder (two exits), production agentic AI at a 200K-user utility, plus a city-government fraud-detection model. Not a citizen (STEM OPT, open to O-1), so civilian team. Worth a chat?

Long (InMail reply)

Hi Emilio, replying on the Lexor Forward Deployed Engineer role. The short version: I'm the ex-founder archetype (bootstrapped two companies, sold both for \$575K), and my current work is exactly the mandate. As the first AI hire at ESC Partners I shipped Maya AI in 2.5 months, a tool-calling agent on Oracle CCS handling 70 to 80% of first-touch volume for a 200K-resident utility. I've also done government fraud detection for the City of Rochester with explainable reason codes. One flag so you can route me correctly: I'm not a US citizen. I'm on F-1 STEM OPT, H-1B eligible, and open to the O-1 path, so civilian team only. If that works, send times; I can relocate to DC fast.
